Re: Engineered Controls International, LLC

Ladies and Gentlemen:

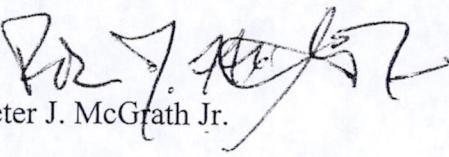

This firm represents Engineered Controls International, LLC (“ECIL”). ECIL recently retained GaiaTech Incorporated (“GaiaTech”) to conduct limited Phase II site investigations of ECIL facilities located at 100 Rego Drive, Elon, Alamance County, North Carolina and (the “Elon Facility”), and 1239 Rock Creek Dairy Road, Whitsett, Gilford County, North Carolina (the “Whitsett Facility”). ECIL received GaiaTech’s reports of the results of those Phase II site investigations on December 22, 2011. Pursuant to NC Gen. Stat. § 143-214.1 and 15A N.C.A.C. 2L.0106, ECIL hereby notifies the Division that GaiaTech’s reports indicate that historical activities at the Elon Facility and the Whitsett Facility appear to have resulted in an increase in the concentration of certain substances in excess of the groundwater standards applicable to such substances, as set forth at 15A N.C.A.C. 2L. The results of GaiaTech’s Phase II investigations are set forth in the following reports (copies of which are enclosed with this letter):

1. Limited Phase II Site Investigation, Engineered Controls International, LLC, 100 Rego Drive, Elon, North Carolina, dated December 2011, prepared by GaiaTech Incorporated; and
2. Limited Phase II Site Investigation, Engineered Controls International, LLC, 1239 Rock Creek Dairy Road, Whitsett, North Carolina, dated December 2011, prepared by GaiaTech Incorporated.

Please contact me if you have any questions regarding this matter or the enclosed reports.

Very truly yours,

Moore & Van Allen PLLC

Peter J. McGrath Jr.

EXECUTIVE SUMMARY

Kirkland and Ellis LLP retained GaiaTech Incorporated (GaiaTech) on behalf of Engineered Controls International, LLC (ECIL) to conduct a limited Phase II site investigation (Phase II) of the ECIL property located at 100 Rego Drive, Elon, Alamance County, North Carolina (the Site). The purpose of the Phase II was to evaluate whether significant subsurface impacts are present related to historical industrial operations conducted by Engineered Controls International, Inc. (ECII) at the Site.

The 13-acre site consists of an approximately 100,000-square-foot building that includes a manufacturing area (including a maintenance shop, compressor room, dipping line area, thermal deburring area, and wastewater treatment area), an engineering room addition (for product testing and R&D), an office area, and a former paint storage room. Asphalt-paved parking and driveways surround the site building. A covered and bermed hazardous waste storage area and fenced valve testing area are located near the southeastern corner of the site building. The eastern section of the site is densely wooded.

ECII was a manufacturer of valves for the LP gas industry. ECII activities at the site included assembly, testing, brazing, welding, thermal de-burring and surface cleaning of valve bodies (primarily brass) that were forged or cast at off-site facilities. Former ECII operations at the site included a trichloroethene (TCE) vapor degreaser and zinc plating lines.

GaiaTech conducted a Phase I Environmental Site Assessment (ESA) in 2010. According to the Phase I ESA Report, the site consisted of undeveloped or agricultural land from as early as 1951 until developed in 1964 for industrial purposes. Kardon Industries, Inc., a manufacturer of corrugated cardboard boxes, occupied the site from 1964 until 1980, when RegO Group acquired the site. ECII acquired the site in 1989. Kardon also utilized a rail spur that is still present to the south of the site building. Details regarding Kardon's operations at the site were not available because Kardon's operations pre-date current record keeping requirements.

ECII had generated large volumes of hazardous wastes including reactive wastes, waste tetrachloroethene (PCE), waste TCE, wastewater treatment sludge, and wastes containing chromium and lead since at least 1990. Although no violations were identified in connection with hazardous waste management at the site, the historical generation of chlorinated solvent wastes (waste PCE resulting from small-scale cleaning activities and waste TCE resulting from vapor degreasing activities), the historical operation of the zinc plating lines and the historical temporary storage of hazardous waste represented the potential for environmental impact. Products manufactured at the site since 1980 had not changed significantly; however, chemicals used and stored on site changed with the removal of the TCE vapor degreaser and zinc plating lines in the 1990s and 2000, respectively.

The Phase I ESA report identified the following Recognized Environmental Condition (REC) at the site:

- Former Site Operations including:

- Former TCE Vapor Degreaser,
- Former Plating Line, and
- Former Solvent-based Painting/Storage.

The Phase I ESA report identified the following noteworthy areas at the site:

- Subgrade Pits and Sumps including:
 - WWTP/dip tank line (with pits and trenches) and
 - Outside Hazardous Waste Storage Area (including sump)
- Uncertain Historical Operations (eastern forested area)
- Prior Occupant Operations

During the Phase II site activities, a vent line attached to the building wall was discovered indicating the existence of a possible underground storage tank (UST). Further investigation determined that the site formerly utilized an 8,000 gallon fuel oil UST located off the southwest corner of the building. Investigation of the former UST was included in this Phase II.

Between July 19 through 21, 2011, a total of 18 soil borings were installed with 10 of the borings converted to temporary groundwater well points and eight converted to permanent groundwater monitoring wells. Additionally, three hand auger borings were installed in the wooded area east of the site building. Twenty-six soil samples were selectively collected and analyzed for volatile organic compounds (VOCs), Semi-VOCs (SVOCs), total petroleum hydrocarbons (TPH) gasoline range organics and diesel range organics (GRO and DRO) and total Resource Conservation and Recovery Act (RCRA) metals. Three samples were also analyzed for hexavalent chromium. Eighteen groundwater samples were analyzed for VOCs, SVOCs, GRO, DRO, and dissolved RCRA metals with three samples analyzed for hexavalent chromium. Soil and groundwater sample results were compared to North Carolina Department of Environmental and Natural Resources (NCDENR) Preliminary Soil Remediation Goals (PSRGs) and Groundwater Quality Standards (GQS), respectively.

Detections of analytes above the screening PSRGs or GQS were considered a release from ECII operations. The location and type of the possible site releases and overall site conditions were evaluated to develop conclusions for the Phase II. The conclusions of the Phase II investigation are as follows:

For the identified REC:

- **Former Site Operations**

Former TCE Vapor Degreaser – The presence of TCE, PCE and the degradation or daughter product Cis 1,2-Dichloroethene (Cis 1,2-DCE) in the groundwater and TCE in soil above the GQS and PSRGs are indicative of a historical release of chlorinated solvents from this operation. Elevated concentrations of GRO were detected above the non-UST petroleum action level in the groundwater samples collected from the former

degreasing area. No DRO or other GRO impacts were found. No other metal impacts were detected.

Former Plating Line – No metals were detected at concentrations above the PSRGs. The Phase II identified no evidence of a release of substances associated with the former Plating Operations.

Former Solvent Based Painting/Storage – The investigation did not identify any soil or groundwater impacts in this area.

For the additional noteworthy areas identified in the Phase I report or during the Phase II:

- **Subgrade Pits/Trenches and Sumps**

WWTP/Dip Tank Line – Elevated concentrations of chlorinated solvent compounds, including TCE, PCE, and their associated breakdown daughter compound Cis 1,2-DCE, and TPH-GRO were detected above the GQS in all the monitoring wells in the areas of the former solvent degreaser, wastewater treatment plant/dip tanks, and associated pits and trenches. The presence of these compounds indicates a historical release from this general area. It is impossible to distinguish from the available data collected in the Phase I or Phase II, the source of release in this area (i.e. former TCE vapor degreaser unit or the WWTP/Dip Tank Line pits and trenches). The likely scenario is that releases from all the units, pits and trenches may have contributed to the historical impacts.

Outside Hazardous Waste Storage Area – Dissolved lead was detected at concentrations above the GQS in groundwater north of this area in two (MW-6 and GP-11) of the three groundwater samples. Mercury and arsenic were detected at concentrations above the PSRGs in one soil sample collected near the hazardous waste storage area sump. The presence of the lead in groundwater and mercury and arsenic in the soil is indicative of a past release from materials stored at this area.

- **Uncertain Historical Operations (forested area):** Despite the existence of a steel drum and piles of construction debris, the limited surficial soil sampling investigation did not find any evidence of historical releases.
- **Prior Occupant Operations:** The investigation did not identify any soil or groundwater impacts that cannot be attributed to past ECII operations.
- **Former Underground Storage Tank:** There were no detections of TPH GRO or DRO above the applicable remediation standard. Given clean confirmatory results of soil samples generated at the time of the UST removal, a significant release from this area is unlikely.

In addition to the area-specific finding presented previously, the following general site conditions were identified:

- Low concentrations of selenium were detected in most of the soil samples, above the PSRGs for protection of groundwater, but below other PSRGs for other exposure pathways. The detection of selenium is believed to represent background conditions of the site.
- Bis(2-ethylhexyl)phthalate was detected above the GQS in a number of newly-installed permanent groundwater monitoring wells. This is likely indicative of cross contamination of new PVC well screens (this chemical commonly used in plasticizer/PVC manufacturer).
- Shallow groundwater was encountered in unconsolidated sandy clay and silts at depths between 27 and 38 feet below ground surface. Based on the surrounding topography, shallow groundwater is expected to flow northeast towards an unnamed intermittent creek located near the eastern property line. This Phase II environmental site investigation was designed only to evaluate the presence of past chemical releases into the subsurface and not to delineate the extent of soil and groundwater impacts. However, based on a lack of contaminant detections in the six perimeter wells (MW-1 through MW-6) it appears likely that the identified solvent and petroleum impacts are restricted within the property boundaries. There is no apparent site groundwater ingestion risk as the water service of the facility is municipally supplied and no drinking water wells are present at the property.

Based on the results of the limited Phase II site investigation, it appears that historical releases of chlorinated solvents, petroleum compounds and/or metals have occurred from the former TCE Vapor Degreasing operations (including the WWTP with the associated pits and trenches) and the Outside Hazardous Waste Storage Area.

1.0 INTRODUCTION

Kirkland and Ellis LLP retained GaiaTech Incorporated (GaiaTech) on behalf of Engineered Controls International, LLC (ECIL) to conduct a limited Phase II site investigation (Phase II) of the ECIL property located at 100 Rego Drive, Elon, Alamance County, North Carolina (the Site). The purpose of the Phase II was to evaluate whether significant subsurface impacts are present related to historical industrial operations conducted by Engineered Controls International, Inc. (ECII) at the Site.

1.1 Site Description and Background

The 13-acre site consists of an approximately 100,000-square-foot building that includes a manufacturing area (including a maintenance shop, compressor room, dipping line area, thermal deburring area, and waste water treatment plant [WWTP]), an engineering room addition (product testing and R&D) along the eastern side of the building, an office area, and a former paint storage room along the exterior of the southeastern corner of the building. Asphalt-paved parking and driveways surround the site building. A covered and bermed hazardous waste storage area and fenced valve testing area are located near the southeastern corner of the site building. The eastern section of the site is densely wooded.

ECII was a manufacturer of valves for the LP gas industry. ECII activities at the site included the assembly of primarily brass valve bodies that were forged or cast at off-site facilities along with miscellaneous parts (rubber seals, washers, knobs, springs, and pipes) that were also manufactured off site. Parts were assembled, tested, brazed, welded, thermally deburred, and Bright Dipped in manual or robotic operations. Thermal deburring was a semi-automated process in which valves were sealed in an air tight chamber that was flooded with a natural gas/oxygen mixture and ignited to burn off filings. Bright Dipping was a process to clean and treat the surface of parts (to remove an oxide layer resulting from thermal deburring) that included steps for alkaline cleaning, muriatic acid pickling, sulfuric/nitric acid cleaning, and chromate sealing. Ancillary ECII operations on site included operation of a WWTP, minor chemical testing in connection with the WWTP, spray painting (of parts in the ductile iron department), research and development, product testing, and equipment maintenance. Former ECII operations at the site included a trichloroethene (TCE) vapor degreaser and zinc plating lines.

GaiaTech conducted a Phase I Environmental Site Assessment (ESA) in 2010. According to the Phase I ESA Report, the site consisted of undeveloped or agricultural land from as early as 1951 until developed in 1964 for industrial purposes. Kardon Industries, Inc., a manufacturer of corrugated cardboard boxes, occupied the site from 1964 until 1980, when RegO Group acquired the site. ECII acquired the site in 1989. Kardon utilized a rail spur that is still present to the south of the site building. Details regarding Kardon's operations at the site were not available because Kardon's operations pre-date current record keeping requirements.

ECII had generated large volumes of hazardous wastes including reactive wastes, waste tetrachloroethene (PCE), waste TCE, wastewater treatment sludge, and wastes containing

chromium and lead since at least 1990. Although no violations were identified in connection with hazardous waste management at the site, the historical generation of chlorinated solvent wastes (waste PCE resulting from small-scale cleaning activities and waste TCE resulting from vapor degreasing activities), the historical operation of the zinc plating lines and historical temporary storage of hazardous waste represented the potential for environmental impact. Products manufactured at the site since 1980 had not changed significantly; however, chemicals used and stored on site changed with the removal of the TCE vapor degreaser and zinc plating lines.

1.2 Recognized Environmental Conditions and Noteworthy Areas

GaiaTech's Phase I ESA identified the following Recognized Environmental Condition (REC) in connection with the site:

- **Former Site Operations:** ECII historically utilized a TCE vapor degreaser, solvent-based paints, and a zinc plating line at the site.

Former TCE Vapor Degreaser: The degreaser, which consisted of a 600-gallon tank, was formerly located in the shipping/receiving area along the eastern side of the site building. The degreaser was operated from 1980 until the 1990s when it was removed from the site. No releases in connection with this degreaser were reported by ECII or identified in available regulatory documentation. Given the duration of this unit's use on site, there was a potential for unreported spills, or small spills over time, to have resulted in chlorinated solvent impacts on site.

Former Plating Line: A zinc plating line was operated from 1980 until 2000. Operation of this line would have likely required the use and storage of various acids, caustics, and zinc containing coatings. This line historically operated in the area east of the current WWTP/Bright Dip area. No obvious staining or evidence of significant releases was identified in the vicinity of this former line; however, this area was considered to have a potential for historical spills or releases to have resulted in subsurface impacts.

Former Solvent-based Painting/Storage: Solvent-based paints were used from 1980 through 1997. GaiaTech observed paint staining on the ramped entrance to the former paint storage room (that opens to the exterior of the building). No obvious staining was observed on the ground surface near the paint storage room: paint storage in this area ceased in 1997. This area was considered to have a potential for historical paint releases to have resulted in subsurface impacts.

The Phase I also identified the following noteworthy areas relating to ECII's site operations:

- **Subgrade Pits/Trenches and Sumps:**

WWTP/dip tank line: Subgrade areas identified at the site included wastewater collection pits and trenches in the WWTP/Bright Dip line tank area. The pits and

trenches were installed in 1981. ECII emptied/inspected the wastewater pits every two years and relined the pits (with a fiberglass resin) every ten years. According to Site Personnel interviewed during the Phase I, no damage or cracks had been identified during inspections. Given the frequency of historical inspection and maintenance, the potential for significant impacts resulting from releases from these subgrade structures appeared low; however, no subsurface samples had been collected to confirm if historical releases had occurred.

Outside Hazardous Waste Storage Area: ECII generated hazardous wastes including metal hydroxide sludge (F006) generated from wastewater treatment operations, corrosive waste (D002 and D008) in the form of sludge collected from the Bright Dip line, spent parts washer solvent (F002), and waste paint. Metal hydroxide sludge was collected in super sacks in the WWTP area by an automated process. This waste was temporarily stored in the outside hazardous waste storage area. The area was bermed and contained a sump that collected liquids that accumulated in the hazardous waste storage area. No leaking or damaged containers were observed by GaiaTech. ECII inspected the hazardous waste area sump regularly. The sump did not regularly hold any liquids and appeared to be in good condition. In addition, non-hazardous wastes generated by ECII included used oil, universal wastes, aqueous paint, scrap metal, cardboard, wooden pallets, and general refuse. No significant staining was observed in the vicinity of the dumpsters or other waste storage areas.

- **Uncertain Historical Operations:** The eastern portion of the site appeared to have been cleared in stages in the 1960s and 1970s, after the site building had been developed, from a previously wooded condition. No structures appeared to have been constructed on this portion of the site. The nature of historical operations in this area could not be discerned. Available aerial photographs did not suggest detrimental uses such as landfilling or chemical storage on this area. Though uses of this area were uncertain, the potential for significant environmental impacts related to historical clearing activities appeared low.
- **Prior Occupant Operations:** Little information related to chemical use and waste generation by Kardon was available. There was a potential for solvent based inks, adhesives, and/or cleaners to have been utilized in historical manufacturing operations. Additionally, petroleum products may have been utilized in connection with equipment maintenance. No records of chemical storage or releases were identified in connection with Kardon because Kardon's operations pre-dated current record keeping requirements. There was a potential for any historical spills or releases by this prior occupant to have resulted in environmental impacts on site.

Other noteworthy areas that were evaluated during the Phase II include:

- **Former Underground Storage Tank:** During the Phase II site activities, a vent line attached to the building wall was discovered suggesting the potential presence of an UST. Further investigation determined that the site formerly utilized an 8,000 gallon

fuel oil underground storage tank (UST) located off the southwest corner of the building. According to newly found documentation, the UST was removed in 1991 and three base-of-excavation soil samples were collected and analyzed for TPH and oil and grease. The results indicated that there were no apparent impacts to the soil; however no groundwater sample was collected.

No other potential for environmental impact from historical uses of the site was identified.

1.3 Scope of Work

GaiaTech developed a Limited Phase II scope of work to investigate potential soil and groundwater impacts associated with historical site operations. Between July 19 and 21, 2011, a total of 18 soil borings were installed with 10 of the borings converted to temporary groundwater well points and eight converted to permanent groundwater monitoring wells. Additionally, three hand auger borings were installed in the wooded area east of the site building. Soil samples were collected and analyzed for the following indicator parameters: volatile organic compounds (VOCs) plus tentatively identified compounds (TICs), Semi-VOCs (SVOCs)+TICs, total petroleum hydrocarbons (TPH) gasoline range organics and diesel range organics (GRO/DRO) and total Resource Conservation and Recovery Act (RCRA) metals. Two soil samples were also analyzed for hexavalent chromium. Groundwater samples were analyzed for the following indicator parameters: VOCs+TICs, SVOCs+TICs, TPH-GRO/DRO and dissolved RCRA metals.

1.4 Geology and Hydrogeology

The 7.5-minute topographic map of the area (*Gibsonville, North Carolina Quadrangle, 1998*) indicated that the site is located at an approximate elevation of approximately 685 to 720 feet above mean sea level. The geologic map of North Carolina indicated that bedrock in the area consists of metamorphosed diorite found at an undetermined depth.

During the GaiaTech investigation, one to three feet of fill material or disturbed soils consisting of sand and gravel or other fill was encountered. Underlying the fill material was a red or yellow and red clayey silt or silty clay. In some cases, this unit was underlain by a tan or white sandy clay or sandy silt unit to the maximum depth explored, 45 feet below ground surface. Shallow groundwater was encountered at depths between 27 and 38 feet below ground surface (bgs). The boring logs from this investigation are presented in Appendix A.

Shallow groundwater flow typically mimics surface topography and flows toward the nearest body of water. Based on the surrounding topography, shallow groundwater is expected to flow northeast towards an unnamed intermittent Creek located near the eastern property line (past the site forested area).

2.0 SOIL SAMPLING

2.1 Methodology

Drilling Activities

Prior to drilling activities, GaiaTech completed a subsurface utility clearance through North Carolina One Call Underground Protection Service. On July 18, 2011, a private line locator was used to locate any potentially buried utilities near the proposed boring locations for safety purposes. The drilling contractor (Carolina Soil Investigations) advanced and installed a total of 21 soil borings; 18 of which were converted to 10 temporary groundwater well points and eight permanent monitoring wells (as shown on Figure 2).

Each of the soil borings was advanced using a Geoprobe® sampling unit. Continuous soil samples were collected utilizing 5-foot stainless steel sampling tubes lined with acetate sample liners. Upon retrieval from the sampling tube, each soil sample was visually inspected for logging purposes and visible evidence of contamination. A portion of the soil sample was placed into a plastic bag for field-screening (described further in the next paragraph) and classification prior to collecting a soil sample for laboratory analysis. Soil characteristics such as soil type, color, moisture, consistency, grain size, odor, and plasticity were recorded on soil boring logs. After the completion of each boring/temporary well, the boring was backfilled with bentonite and where paved, patched with asphalt or concrete to grade.

Soil Screening and Logging

Each of the soil samples was screened for ionizable volatile organics contamination using a Mini-Rae photo-ionization detector (PID) equipped with a 10.6eV lamp, calibrated to a 100 parts per million - volumetric (ppmv) isobutylene standards. The field screening was used to provide an indication of the potential presence of VOCs to aid in the selection of samples for laboratory analysis. Specific PID field screening procedures were as follows:

- The soil sample was placed in a sample bag.
- The soil boring number and sample depth was written on the sample bag.
- The sample was allowed to warm to ambient temperatures.
- The PID was utilized to draw the headspace from above the soil-air interface.
- The maximum PID reading was recorded on each respective soil boring log.

Boring logs from the investigation are presented in Appendix A. Photographs of the site and investigation activities are included as Appendix B.

Soil Sampling

Select soil samples were collected and analyzed to identify potential soil impacts related to the historical operations. All soil samples were analyzed for the following indicator parameters: VOCs+TICs, SVOCs+TICs, TPH GRO/DRO and total RCRA metals, unless otherwise noted.

Each collected sample was placed in appropriate laboratory supplied bottles. The samples were then secured in a sample cooler and preserved with ice. Under strict sample chain-of-custody procedures, the samples were delivered to Environmental Science Corporation (ESC), a North Carolina Department of Environment and National Resources (NCDENR) accredited laboratory.

Decontamination

Upon completion of soil boring and sampling activities, and between uses to avoid cross contamination, all downhole soil boring and non-dedicated sampling equipment was decontaminated using an Alconox®/water wash and scrubbing, followed by a water rinse. Once the last soil samples were collected and the temporary well pulled, the borehole was back-filled with bentonite, and the surface was restored (to the extent feasible) to its original condition or a permanent well was installed. Photographs of the field activities are presented in Appendix B.

2.2 Soil Standards

To determine if a REC or noteworthy area had any historical releases, each sample result was screened against a published screening standard, typically established by the State in which the Site is located. For this Site, soil sample laboratory results were compared to the NCDENR Preliminary Soil Remediation Goals (PSRG), published for the Inactive Hazardous Sites Program. These PSRGs include the EPAs Remediation Screening Limits (RSLs) for soil and tap water, federal drinking water standards Maximum Concentration Limits (MCLs), NC Groundwater Protection Standard 2L (IMAC) and Csat. PSRGs are listed for residential and industrial property scenarios as well as protection of groundwater scenarios. For this evaluation, samples were compared to all three scenarios. In cases where petroleum impacts were suspected, detections were also compared to the NCDENR's TPH action levels for non-UST petroleum releases, for industrial sites. Any resultant concentrations found above the PSRGs or TPH action limits will suggest a historical release. The results of this investigation along with applicable PSRGs and TPH action levels are listed in Table 1.

2.3 Soil Investigation Results

- A total of 26 soil samples were collected for analysis. A summary of the soil analytical results is presented as Table 1, with the complete laboratory analytical reports included as Appendix C. The soil sample results are briefly described below:

- **Former Site Operations**

Former TCE Vapor Degreaser – Three soil borings (GP-1, GP-2 and MW-7) were installed to investigate this area. Moderate solvent odors were observed and slightly elevated PID readings (above background) of up to 59.7 ppmv were recorded. Soil samples were selected based on these elevated PID readings and analyzed for indicator parameters. One sample (GP-2, 5-7') was also analyzed for hexavalent chromium.

The laboratory results indicated that no SVOCs or RCRA metals were detected in excess of the industrial PSRGs, with the exception of the selenium, whose concentration exceeded the PSRGs for the protection of groundwater at all 3 borings. Trichloroethene (TCE) was also detected in two of the three boring locations above the PSRGs for the protection to groundwater. No other VOCs were detected to be above the PSRGs.

Former Plating Line – Two soil borings (GP-3 and GP-6) were installed to investigate this area. Moderate solvent odors were observed and elevated PID readings (above background) of up to 68 ppmv. Soil samples were selected based on these elevated PID readings and analyzed for VOCs, SVOCs, TPH-GRO/DRO and total RCRA metals). Zinc was analyzed in the soil sample collected from GP-3.

The laboratory results indicated that no significant VOCs, SVOCs or metals were detected in excess of the industrial PSRGs, with the exception of the selenium, whose concentrations exceeded PSRGs for the protection of groundwater.

Former Solvent Based Painting/Storage - Two soil borings (GP-9 and MW-5) were installed to investigate this area. No odors, elevated PID readings or suspect staining was observed in either boring. Soil samples were collected and analyzed for indicator parameters.

The laboratory results indicated that no VOCs, SVOCs or metals were detected in excess of the industrial PSRGs, with the exception of the selenium, whose concentration exceeded PSRGs for the protection of groundwater in both samples.

Subgrade Pits/Trenches and Sumps

WWTP/Dip Tank Line – Five soil borings (GP-4 through GP-8) were installed to investigate this area. Moderate solvent odors were observed and elevated PID readings (above background) of up to 37 ppmv were recorded. Soil samples were selected based on these elevated PID readings and analyzed for indicator parameters. One sample (GP-6) was also analyzed for hexavalent chromium and one sample (GP-5) was also analyzed for zinc.

The laboratory results indicated that no VOCs, SVOCs or metals were detected above the industrial PSRGs, with the exception of the selenium, whose concentration exceeded the PSRGs for protection of groundwater at most boring locations. TPH-GRO and DRO concentrations were found to exceed action levels related to non-UST petroleum releases.

Outside Hazardous Waste Storage Area – Three soil borings (GP-10, GP-11 and MW-6) were installed to investigate this area. Borings GP-10 and MW-6 were installed adjacent to the hazardous waste storage building and Boring GP-11 was installed

adjacent to the hazardous waste storage area sump. No odors, elevated PID readings or suspect staining were observed in any of the borings. Soil samples were collected and analyzed for indicator parameters.

The laboratory results indicated that no VOCs or SVOCs were detected above the industrial PSRGs. Selenium was detected in all borings above the PSRGs for the protection of groundwater. Arsenic exceeded the industrial soil PSRGs and mercury exceeded both the residential and protection of groundwater PSRGs at GP-10.

- **Uncertain Historical Operations (forested area):** Three shallow soil borings (HA-1, HA-2 and HA-3) were installed to investigate this area. HA-1 was installed adjacent to an empty abandoned drum and HA-2 and HA-3 were installed in the forested area. Near HA-1, several low piles of overgrown construction debris were also observed. Soil samples were collected and analyzed for VOCs, SVOCs, TPH-GRO/DRO and total RCRA metals.

The laboratory results indicated that no VOCs or SVOCs were detected above the industrial PSRGs. Selenium was detected in all borings at concentrations in excess of the protection of groundwater.

- **Prior Occupant Operations –** Four soil borings (MW-1 through MW-4) were installed around the site building to investigate this area. Boring MW-4 was also used to investigate the soil conditions adjacent to the former fuel oil UST. Soil samples were collected and analyzed for VOCs, SVOCs, and total RCRA metals.

The laboratory results indicated that no VOCs or SVOCs were detected above the industrial PSRGs. Selenium was detected in all borings at concentrations above the protection of groundwater PSRGs.

- **Former Underground Storage Tank:** Boring MW-4 was used to investigate the soil conditions adjacent to the former fuel oil UST. Soil samples were collected and analyzed for indicator parameters.

The laboratory results indicated that no VOCs or SVOCs were detected above the industrial PSRGs. Selenium was detected at a concentration above the protection of groundwater PSRGs.

2.4 Discussion

The overall investigation results identify no active/ongoing sources of soil contamination. Concentrations of TCE, detected in two soil samples (GP-2 and MW-7) collected from the former degreaser area, exceeded the PSRGs for protection of groundwater, suggest that chlorinated solvents have been released into the subsurface from former solvent degreasing operation. No other VOCs were detected at concentrations above the PSRGs.

Both TPH-GRO and TPH-DRO were not detected in any of the soil samples at concentrations above the action levels for non-UST petroleum releases. There is no evidence of any significant historical releases of petroleum compounds in the soil.

Soil analytical results identify no SVOCs in any of the soil borings in excess of the PSRGs.

Concentrations of mercury and arsenic were detected above the PSRGs for industrial and protection of groundwater in only one sample collected from near the hazardous waste storage area sump. Low concentrations of selenium were detected in most of the soil samples, above the PSRGs for protection of groundwater PSRGs, but below the PSRGs for other exposure pathways. It appears likely that the selenium detections represent background conditions of the site. No other overall metals impacts were found.

3.0 GROUNDWATER SAMPLING

3.1 Methodology

Seven 2-inch diameter permanent monitoring wells (MW-1 through MW-7), one 1-inch diameter permanent monitoring well and 10 temporary groundwater well points were installed to assess the groundwater conditions at the site. The approximate locations of the borings/wells are shown on Figure 2. The complete soil boring logs/well construction diagrams are included as Appendix A.

The permanent groundwater monitoring wells and the temporary groundwater well points were screened to intercept the shallow groundwater table beneath the site utilizing a 10-foot PVC well screen. Modified low flow sampling techniques were utilized to collect groundwater samples from each well. Groundwater samples were collected using a flow controlled submersible pump or check valve and dedicated disposable plastic tubing. Approximately one to five gallons of water were purged from each well prior to sampling. Purging was considered complete when the water became relatively clear and free of sediment. Groundwater samples were collected following the purging of the well and transferred into the appropriate laboratory supplied bottles with proper preservatives where necessary. Dissolved metals portion of the groundwater samples were filtered using a 0.45 µm pore size filter prior to collection. All of the samples were then secured in a sample cooler and preserved with ice. Under strict sample chain-of-custody procedures, the samples were delivered to the certified laboratory, ESC. Samples were analyzed for the following indicator parameters: VOCs+TICs, SVOCs+TICs, TPH GRO/DRO, and dissolved RCRA metals, unless otherwise noted.

3.2 Groundwater Screening Standards

Groundwater sample laboratory results were compared to the NCDENR's Division of Water Quality's water quality standards listed under North Carolina Administrative Code (NCAC) Title 15A, Subchapter 2L and the NCDENR's PSRGs table. The results of this investigation along with applicable groundwater quality standards (GQS) are listed in Table 2. The laboratory analytical report is provided in Appendix C.

3.3 Groundwater Investigation Results

Shallow groundwater was encountered at each of the 18 borings between 27 and 38 feet bgs. A groundwater sample was collected from each well, for a total of 18 groundwater samples. Groundwater analytical results are presented on Table 2 and the laboratory analytical report included in Appendix C. The sampling results are summarized below for each REC or noteworthy area:

- **Former Site Operations**

Former TCE Vapor Degreaser – Two permanent monitoring wells and one temporary well point (GP-2, MW-7 and GP-1, respectively) were installed to investigate this area.

Groundwater samples were collected from each well/well point and analyzed for indicator parameters.

The laboratory analytical results indicated that no metals were detected above the GQS. Concentration of TPH-GRO was detected above of the GQS in all 3 groundwater samples. Three VOCs (TCE, PCE, and cis-1,2-dichloroethene (DCE)) concentrations were also detected above the GQS. No other VOCs compounds were detected above the GQS. One SVOC, bis(2-ethylhexyl)phthalate, was detected in a concentration above the GQS in MW-7 sample. No other SVOCs or metals were detected above the respective GQS.

Former Plating Line – Two temporary groundwater well points (GP-3 and GP-6) were installed to investigate this area. Groundwater samples were collected and analyzed for indicator parameters.

The laboratory analytical results indicated that two VOCs (PCE and TCE) were detected in excess of the GQS. No other VOCs were detected above the GQS. No SVOCs or metals were detected above of the respective GQS.

Former Solvent Based Painting/Storage – One temporary well point and one permanent monitoring well (GP-9 and MW-5) were installed to investigate this area. Groundwater samples were collected from each well point/well and analyzed for indicator parameters.

The laboratory results indicated that no VOCs or metals were detected above the GQS. One SVOC, bis(2-ethylhexyl)phthalate, was detected in a concentration above the GQS in MW-5 sample. No other SVOCs were detected above the GQS.

▪ Subgrade Pits/Trenches and Sumps

WWTP/Dip Tank Line – Five temporary groundwater well points (GP-4 through GP-8) were installed to investigate this area. Groundwater samples were collected from each and analyzed for the indicator parameters.

The laboratory analytical results indicated that two VOCs (PCE and TCE) concentrations were detected above the GQS from all five groundwater samples collected in the area. An additional VOC, bromodichloromethane, was detected in concentrations above the GQS at GP-5. No other VOCs and no SVOCs or metals were detected at concentrations above the GQS.

Outside Hazardous Waste Storage Area – Two temporary groundwater well points and one permanent monitoring well (GP-10, GP-11 and MW-6) were installed to investigate this area. Groundwater samples were collected in each and analyzed for indicator parameters.

The laboratory analytical results indicated that no VOCs concentrations were detected above the GQS. Dissolved lead and SVOC compound, bis(2-ethylhexyl)phthalate, were detected in two samples (MW-6 and GP-11) at concentrations above the GQS. No other indicator parameters were detected above the GQS.

- **Uncertain Historical Operations (forested area):** No groundwater samples were collected in this area, due to the inaccessibility of the mechanized drilling equipment
- **Prior Occupant Operations –** Four permanent monitoring wells (MW-1 through MW-4) were installed around the site building perimeter to investigate this issue, in addition to the results obtained from other samples. Well MW-4 was also used to evaluate the groundwater conditions adjacent to the former fuel oil UST. Groundwater samples were collected and analyzed for indicator parameters.

The laboratory results indicated that no VOCs, TPH-GRO, TPH-DRO or metals were detected at concentrations above the GQS. Low levels of one SVOC, bis(2-ethylhexyl)phthalate, were detected at concentrations above the GQS in MW-2 and MW-3. No other SVOCs were detected above the GQS.

- **Former Underground Storage Tank:** MW-4 was used to evaluate the groundwater conditions adjacent to the former fuel oil UST. A groundwater sample was collected and analyzed for the indicator parameters

The laboratory results indicated that no VOCs, TPH-GRO, TPH-DRO or metals were detected at concentrations above the GQS.

3.4 Discussion

The overall investigation results identified elevated concentrations of chlorinated solvent compounds, including TCE and PCE, above the GQS in all the wells in the vicinity of the former TCE Vapor Degreaser, WWTP/dip tanks and associated trenches. Concentrations of TPH-GRO were also detected at levels exceeding the non-UST petroleum action level in the former degreasing area. These detections suggest that the former solvent degreasing operations have released chlorinated solvents and petroleum compounds to the subsurface. No other VOCs, with the exceptions of bromodichloromethane (which is believed to be a laboratory artifact), were detected at GP-5.

Dissolved lead was detected at two locations (adjacent to the hazardous waste storage area and pit/sump) above the GQS. Additionally, bis(2-ethylhexyl)phthalate was also detected in six of seven permanent groundwater monitoring wells and one temporary well point above of the GQS. The detection of this SVOC compound is likely an artifact related to the use of PVC monitoring wells. Bis(2-ethylhexyl)phthalate is commonly used as a commercial plasticizer.

4.0 CONCLUSIONS

GaiaTech has completed the Limited Phase II Site Investigation at the ECIL site located at 100 Rego Drive, in Elon, North Carolina. Between July 19 through 21, 2011, a total of 18 soil borings were installed with 10 of the borings converted to temporary groundwater wells points and eight converted to permanent monitoring wells. Additionally, three hand auger borings were installed in the wooded area east of the site building. Twenty-two soil samples were selectively collected and analyzed for VOCs, SVOCs, TPH GRO/DRO and RCRA metals. Three samples were additional tested for hexavalent chromium. Eighteen groundwater samples were analyzed VOCs, SVOCs, and TPH GRO/DRO and dissolved RCRA metals. Additionally, 3 samples were also tested for hexavalent chromium.

Soil and groundwater sample results were compared to North Carolina Department of Environmental and Natural Resources (NCDENR) Preliminary Soil Remediation Goals (PSRGs) and Groundwater Quality Standards (GQS), respectively.

Detections of analytes above the screening PSRGs or GQS were considered a release from the operations. The location and type of the possible site releases and overall site conditions were evaluated to develop conclusions for the Phase II. The conclusions of the Phase II investigation are as follows:

For the identified REC:

▪ **Former Site Operations**

Former TCE Vapor Degreaser – The presence of TCE, PCE and the degradation or daughter product Cis 1,2-Dichloroethene (Cis 1,2-DCE) in the groundwater and TCE in soil above the GQS and PSRGs are indicative of a historical release of chlorinated solvents from this operation. Elevated concentrations of GRO were detected above the non-UST petroleum action level in the groundwater samples collected from the former degreasing area. No DRO or other GRO impacts were found. No other metal impacts were detected.

Former Plating Line – No metals were detected at concentrations above the PSRGs. The Phase II identified no evidence of a release of substances associated with the Plating Operations.

Former Solvent Based Painting/Storage – The investigation did not identify any soil or groundwater impacts in this area.

For the additional noteworthy areas identified in the Phase I report or during the Phase II:

- **Subgrade Pits/Trenches and Sumps**

WWTP/Dip Tank Line – Elevated concentrations of chlorinated solvent compounds, including TCE, PCE, and their associated breakdown daughter compound Cis 1,2-DCE, and TPH-GRO were detected above the GQS in all the monitoring wells in the areas of the former solvent degreaser, wastewater treatment plant/dip tanks, and associated pits and trenches. The presence of these compounds indicates a historical release from this general area. It is impossible to distinguish from the available data collected in the Phase I or Phase II the source of release in this area (i.e. former TCE vapor degreaser unit or the WWTP/Dip Tank Line pits and trenches). The likely scenario is that releases from all the units, pits and trenches may have contributed to the historical impacts.

Outside Hazardous Waste Storage Area – Dissolved lead was detected at concentrations above the GQS in groundwater north of this area in two (MW-6 and GP-11) of the three groundwater samples. Mercury and arsenic were detected at concentrations above the PSRGs in one soil sample collected near the hazardous waste storage area sump. The presence of the lead in groundwater and mercury and arsenic in the soil is indicative of a past release from materials stored at this area.

- **Uncertain Historical Operations (forested area):** Despite the existence of a steel drum and piles of construction debris, the limited surficial soil sampling investigation did not find any evidence of historical releases.
- **Prior Occupant Operations:** The investigation did not identify any soil or groundwater impacts that cannot be attributed to past ECII operations.
- **Former Underground Storage Tank:** There were no detections of TPH GRO or DRO above the applicable remediation standard. Given clean confirmatory results of soil samples generated at the time of the UST removal, a significant release from this area is unlikely.

In addition to the area-specific finding presented previously, the following general site conditions were identified:

- Low concentrations of selenium were detected in most of the soil samples, above the PSRGs for protection of groundwater, but below other PSRGs for other exposure pathways. The detection of selenium is believed to represent background conditions of the site.
- Bis(2-ethylhexyl)phthalate was detected above the GQS in a number of newly-installed permanent groundwater monitoring wells. This is likely indicative of cross contamination of new PVC well screens (this chemical commonly used in plasticizer).

- Shallow groundwater was encountered in unconsolidated sandy clay and silts at depths between 27 and 38 feet below ground surface. Based on the surrounding topography, shallow groundwater is expected to flow northeast towards an unnamed intermittent Creek located near the eastern property line. This Phase II environmental site investigation was designed only to evaluate the presence of past chemical releases into the subsurface and not to delineate the extent of soil and groundwater impacts. However, based on a lack of contaminant detections in the six perimeter wells (MW-1 through MW-6) it appears likely that the identified solvent and petroleum impacts are restricted within the property boundaries. There is no apparent site groundwater ingestion risk as the water service of the facility is municipally supplied and no drinking water wells are present at the property.

Based on the results of the limited Phase II site investigation, it appears that historical releases of chlorinated solvents, petroleum compounds and metals have occurred in the vicinity of the former TCE Vapor Degreasing operations (including the WWTP with the associated pits and trenches) and the Outside Hazardous Waste Storage Area.

5.0 LIMITATIONS

This report is prepared for the sole benefit of Engineered Controls International, LLC. and not be relied upon by any other person or entity. This report and the findings shall not, in whole or in part, be distributed or transmitted to any other party, nor used by any other party, without the prior written consent of GaiaTech and an authorized representative of Engineered Controls International, LLC.

GaiaTech has conducted these professional services in accordance with current scientific principles and industrial standards of practices in the fields of environmental science and engineering on the date the work was conducted and in the same geographical area of the subject site for similar studies. GaiaTech's findings and recommendations must be considered as professional opinions based upon the limited data collected during the course of the environmental site investigation, which is limited in time and scope. GaiaTech makes no warranty, express or implied.

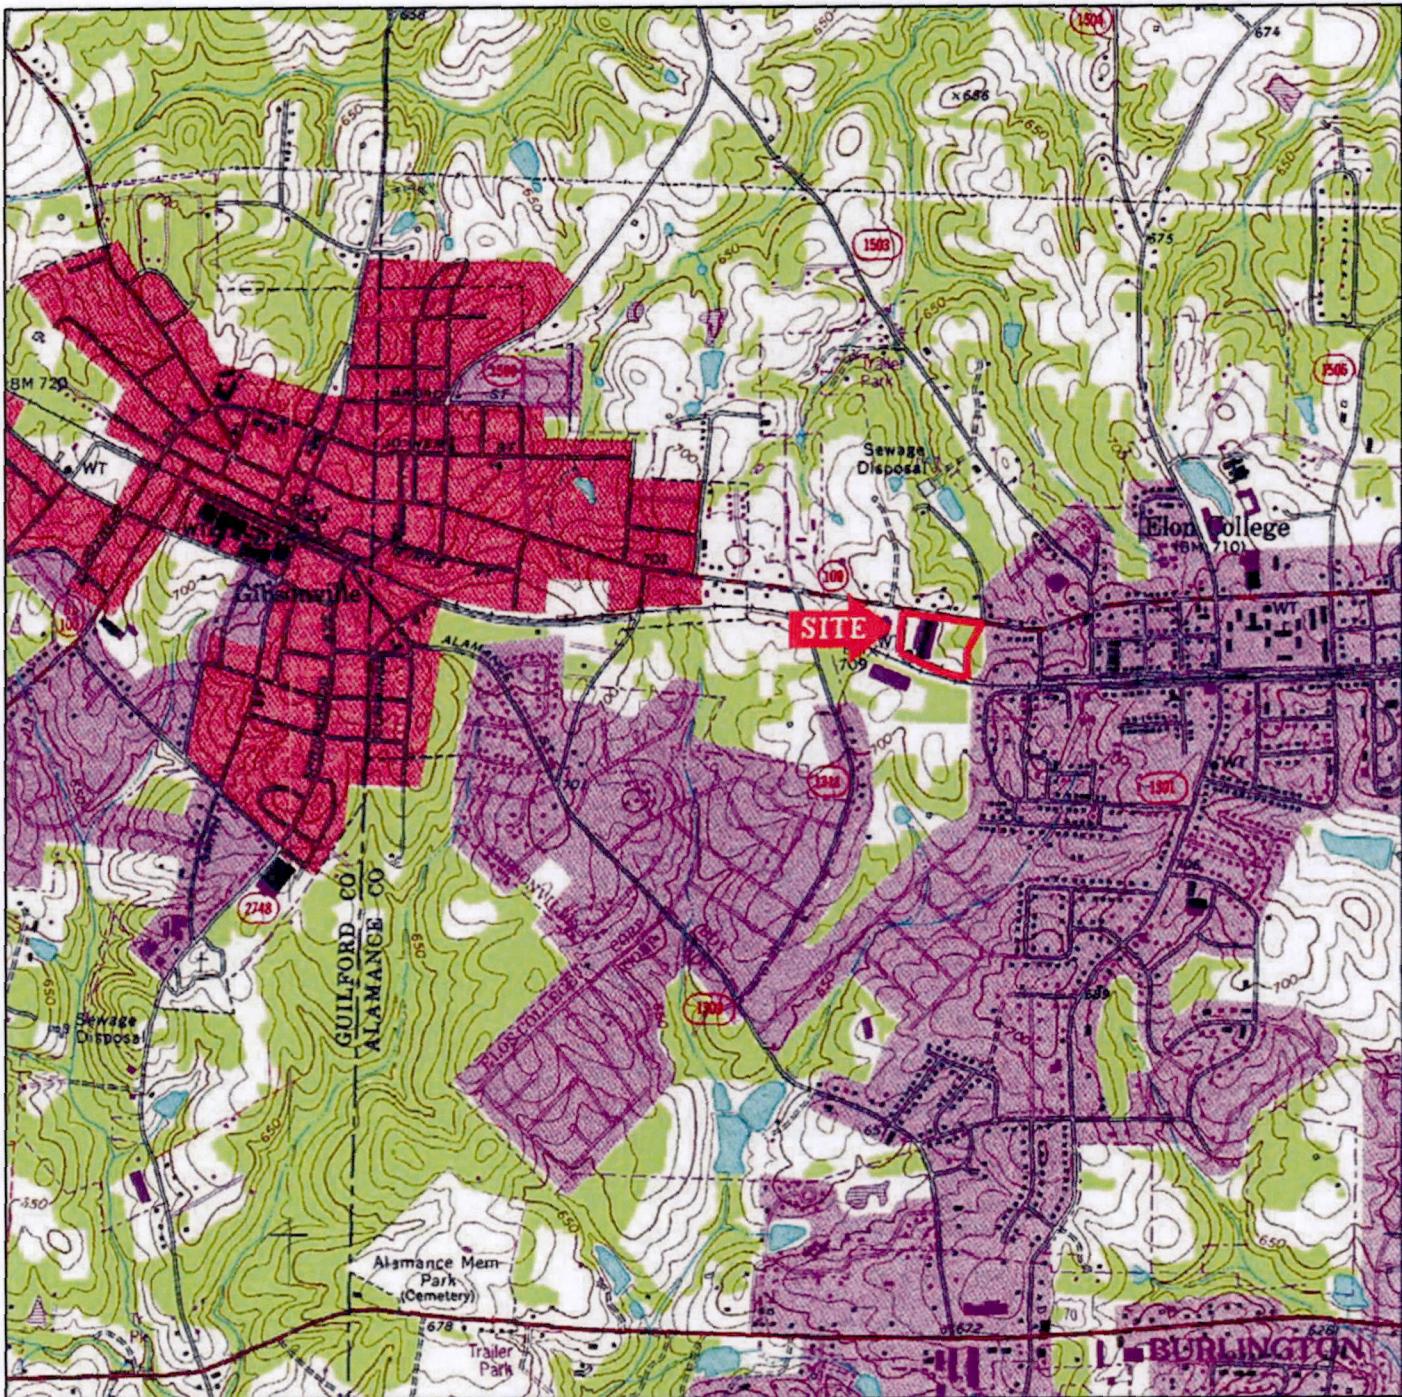

Only a limited number of soil and groundwater samples were collected from widely spaced soil borings. The variations among these samples and results may not become evident until further investigation. In the event that more data are available, it may be necessary to re-assess the conditions of the subject site in order to revise the conclusions and recommendations contained in this report.

Independent laboratories have performed analytical laboratory analyses. GaiaTech has derived the findings and recommendations, in part, from the analytical reports. These findings are contingent upon the validity of the analytical reports.

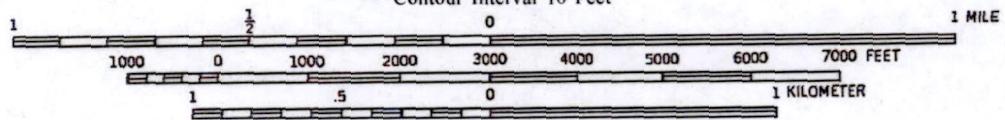

Limited soil and groundwater samples were analyzed for specific parameters as detailed in the report. Other chemical compounds, which were not analyzed for, may exist at the site, although unlikely based upon available information.

FUNCTION INFORMATION
Date/Time Started : 7/21/11
Date/Time Completed : 7/21/11
Total Depth of Boring : 45 ft bgs
Total Depth of Well : 45 ft bgs

Logged By : Larry
Drilling Method : Geoprobe
Hole Diameter : 2-inch well, 1 inch boring
Drilling Company : Carolina Soil Investigations
Sampling Method : Macro-Core

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high
L1	(ESC) The associated batch LCS exceeded the upper control limit, which indicates a high bias; The sample analyte was "not detected" and is therefore unaffected.
O	(ESC) Sample diluted due to matrix interferences that impaired the ability to make an accurate analytical determination. The detection limit is elevated in order to reflect the necessary dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

WG547547	SAMP		Hexachloroethane	R1791050	J3
WG547510	SAMP		Styrene	R1785570	J4

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low
O	(ESC) Sample diluted due to matrix interferences that impaired the ability to make an accurate analytical determination. The detection limit is elevated in order to reflect the necessary dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low
O	(ESC) Sample diluted due to matrix interferences that impaired the ability to make an accurate analytical determination. The detection limit is elevated in order to reflect the necessary dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low
P1	RPD value not applicable for sample concentrations less than 5 times the reporting limit.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

REPORT OF ANALYSIS

August 19, 2011

Larry Bertsch
GAIATech - Chicago, IL
135 S. LaSalle St, Ste 3500
Chicago, IL 60603

Date Received : July 22, 2011
Description : Site Investigation
Sample ID : MW-5 3-5FT
Collected By : Larry Bertsch
Collection Date : 07/19/11 15:15

ESC Sample # : L531123-01

Site ID : ELON NC
Project # : B11164100

Parameter	Result	Det. Limit	Units	Method	Date	Dil.
Chromium, Hexavalent	BDL	2.0	mg/kg	3060A/7196A	08/19/11	1
ORP	63.		mV	2580	08/16/11	1
pH	5.0		su	9045D	08/17/11	1
Total Solids	64.9		%	2540G	07/28/11	1

BDL - Below Detection Limit

Det. Limit - Practical Quantitation Limit(PQL)

Note:

The reported analytical results relate only to the sample submitted.
This report shall not be reproduced, except in full, without the written approval from ESC.

VOLATILES ANALYSIS DATA SHEET
TENTATIVELY IDENTIFIED COMPOUNDS

Client Name:	<u>GAIA Tech - Chicago, IL</u>	Client ID:	<u>GP-1 5-7FT</u>
Project Desc.	<u>Site Investigation</u>	ESC Sample No:	<u>L527450-19</u>
Matrix:	<u>SOIL</u>	Lab File ID:	<u>0727_14</u>
Date Collected:	<u>7/20/2011</u>	Dilution Factor:	<u>1.00</u>
Date Analyzed:	<u>7/27/2011</u>		

Tentatively Identified compounds (TIC) refers to substances not present in the list of target compounds. Therefore, not all TIC's are identified and quantitated using individual standards. TIC listings are prepared utilizing a computerized library search routine of electron impact mass spectral data and evaluation of the relevant data by a mass spectral data specialist. Quantitation is accomplished by relative peak area of the TIC compared to that of the nearest internal standard from the total ion chromatogram. TIC's are identified and quantitated only if the peak area is 10% or more of that of the nearest internal standard.

Concentration units:
mg/kg

TIC listings are prepared utilizing a computerized library search routine of electron impact mass spectral data and evaluation of the relevant data by a mass spectral data specialist. Quantitation is accomplished by relative peak area of the TIC compared to that of the nearest internal standard from the total ion chromatogram. TIC's are identified and quantitated only if the peak area is 10% or more of that of the nearest internal standard.

Concentration units:

Number of TICs Found:	0	_____

VOLATILES ANALYSIS DATA SHEET TENTATIVELY IDENTIFIED COMPOUNDS

Client Name:	<u>GAIA Tech - Chicago, IL</u>	Client ID:	<u>HA-1 0-1 FT</u>
Project Desc.	<u>Site Investigation</u>		
Matrix:	<u>SOIL</u>	ESC Sample No:	<u>L529395-01</u>
Date Collected:	<u>7/21/2011</u>	Lab File ID:	<u>0804_12</u>
Date Analyzed:	<u>8/4/2011</u>	Dilution Factor:	<u>1.00</u>

Tentatively Identified compounds (TIC) refers to substances not present in the list of target compounds. Therefore, not all TIC's are identified and quantitated using individual standards. TIC listings are prepared utilizing a computerized library search routine of electron impact mass spectral data and evaluation of the relevant data by a mass spectral data specialist. Quantitation is accomplished by relative peak area of the TIC compared to that of the nearest internal standard from the total ion chromatogram. TIC's are identified and quantitated only if the peak area is 10% or more of that of the nearest internal standard.
